Computer Applications

Assignment: Look at the list of students on my website. You are to create a spreadsheet showing the genders of these students. You will have columns for each grade, and a row for boys and a row for girls. You need to include a total row and a total column and use the correct formula to total them up.

When you are done entering the data, you need to use cell styles, etc. to format the spreadsheet.

Create a 3D column chart that shows the four classes and their respective number of students of each gender. The classes should be on the x axis and the number of students should be on the y axis. Move the chart to a new sheet, and name the sheet tab **students chart**. Format the chart in a way that looks professional and is easy to read. Include all three chart titles as well as data labels showing the number of students for each section.

This is a test grade.
